**TITLE OF THE INVENTION****N-BENZYLINDOL-3-YL PROPANIC ACID DERIVATIVES AS CYCLOOXYGENASE-2 INHIBITORS****5   BACKGROUND OF THE INVENTION**

This invention relates to methods of treating cyclooxygenase mediated diseases and certain pharmaceutical compositions therefor.

Non-steroidal, anti-inflammatory drugs exert most of their anti-inflammatory, analgesic and antipyretic activity and inhibit hormone-  
10 induced uterine contractions and certain types of cancer growth through inhibition of prostaglandin G/H synthase, also known as cyclooxygenase. Initially, only one form of cyclooxygenase was known, this corresponding to cyclooxygenase-1 or the constitutive enzyme, as originally identified in bovine seminal vesicles. More recently the gene  
15 for a second inducible form of cyclooxygenase (cyclooxygenase-2) has been cloned, sequenced and characterized initially from chicken, murine and human sources. This enzyme is distinct from the cyclooxygenase-1 which has been cloned, sequenced and characterized from various sources including the sheep, the mouse and man. The second form of  
20 cyclooxygenase, cyclooxygenase-2, is rapidly and readily inducible by a number of agents including mitogens, endotoxin, hormones, cytokines and growth factors. As prostaglandins have both physiological and pathological roles, we have concluded that the constitutive enzyme, cyclooxygenase-1, is responsible, in large part, for endogenous basal  
25 release of prostaglandins and hence is important in their physiological functions such as the maintenance of gastrointestinal integrity and renal blood flow. In contrast, we have concluded that the inducible form, cyclooxygenase-2, is mainly responsible for the pathological effects of prostaglandins where rapid induction of the enzyme would occur in  
30 response to such agents as inflammatory agents, hormones, growth factors, and cytokines. Thus, a selective inhibitor of cyclooxygenase-2 will have similar anti-inflammatory, antipyretic and analgesic properties to a conventional non-steroidal anti-inflammatory drug, and in addition would inhibit hormone-induced uterine contractions and have potential

- 2 -

anti-cancer effects, but will have a diminished ability to induce some of the mechanism-based side effects. In particular, such a compound should have a reduced potential for gastrointestinal toxicity, a reduced potential for renal side effects, a reduced effect on bleeding times and possibly a  
5 lessened ability to induce asthma attacks in aspirin-sensitive asthmatic subjects.

Such a compound would also be of use in the treatment of Alzheimer's disease and to inhibit bone resorption (for use in the treatment of osteoporosis).

10 A brief description of the potential utility of cyclooxygenase-2 is given in an article by John Vane, *Nature*, Vol. 367, pp. 215-216, 1994.

Optical Isomers - Diastereomers - Geometric Isomers

- 17 -

Some of the compounds described herein contain one or more asymmetric centers and may thus give rise to diastereomers and optical isomers. The present invention is meant to comprehend such possible diastereomers as well as their racemic and resolved,  
5 enantiomerically pure forms and pharmaceutically acceptable salts thereof.

The pharmaceutical compositions of the present invention comprise a compound of Formula I as an active ingredient or a pharmaceutically acceptable salt, thereof, and may also contain a  
10 pharmaceutically acceptable carrier and optionally other therapeutic ingredients. The term "pharmaceutically acceptable salts" refers to salts prepared from pharmaceutically acceptable non-toxic bases including inorganic bases and organic bases. Salts derived from inorganic bases include aluminum, ammonium, calcium, copper, ferric, ferrous, lithium,  
15 magnesium, manganic salts, manganous, potassium, sodium, zinc, and the like. Particularly preferred are the ammonium, calcium, magnesium, potassium, and sodium salts. Salts derived from pharmaceutically acceptable organic non-toxic bases include salts of primary, secondary, and tertiary amines, substituted amines including naturally occurring  
20 substituted amines, cyclic amines, and basic ion exchange resins, such as arginine, betaine, caffeine, choline, N,N-dibenzylethylenediamine, diethylamine, 2-diethylaminoethanol, 2-dimethylaminoethanol, ethanolamine, ethylenediamine, N-ethylmorpholine, N-ethylpiperidine, glucamine, glucosamine, histidine, hydrabamine, isopropylamine, lysine,  
25 methylglucamine, morpholine, piperazine, piperidine, polyamine resins, procaine, purines, theobromine, triethylamine, trimethylamine, tripropylamine, tromethamine, and the like.

It will be understood that in the discussion of methods of treatment which follows, references to the compounds of Formula I are  
30 meant to also include the pharmaceutically acceptable salts.

The Compound of Formula I is useful for the relief of pain, fever and inflammation of a variety of conditions including rheumatic fever, symptoms associated with influenza or other viral infections, common cold, low back and neck pain, dysmenorrhea, headache,

- 18 -

toothache, sprains and strains, myositis, neuralgia, synovitis, arthritis, including rheumatoid arthritis, degenerative joint diseases (osteoarthritis), gout and ankylosing spondylitis, bursitis, burns, injuries, following surgical and dental procedures. In addition, such a compound may inhibit  
5 cellular neoplastic transformations and metastatic tumor growth and hence can be used in the treatment of cancer. Compound I may also be of use in the treatment and/or prevention of cyclooxygenase-mediated proliferative disorders such as may occur in diabetic retinopathy and tumour angiogenesis.

10 Compound I will also inhibit prostanoid-induced smooth muscle contraction by preventing the synthesis of contractile prostanoids and hence may be of use in the treatment of dysmenorrhea, premature labor, asthma and eosinophil related disorders. It will also be of use in the treatment of Alzheimer's disease and for decreasing bone loss in  
15 postmenopausal women (that is, treatment of osteoporosis).

By virtue of its high cyclooxygenase-2 (COX-2) activity and/or its specificity for cyclooxygenase-2 over cyclooxygenase-1 (COX-1), compound I will prove useful as an alternative to conventional non-steroidal anti-inflammatory drugs (NSAID'S) particularly where such  
20 non-steroidal anti-inflammatory drugs may be contra-indicated such as in patients with peptic ulcers, gastritis, regional enteritis, ulcerative colitis, diverticulitis or with a recurrent history of gastrointestinal lesions; GI bleeding, coagulation disorders including anemia such as hypoprothrombinemia, haemophilia or other bleeding problems; kidney  
25 disease; those prior to surgery or taking anticoagulants.

Similarly, compound I will be useful as a partial or complete substitute for conventional NSAID'S in preparations wherein they are presently co-administered with other agents or ingredients. Thus in further aspects, the invention encompasses pharmaceutical compositions  
30 for treating cyclooxygenase-2 mediated diseases as defined above comprising a non-toxic therapeutically effective amount of the compound of Formula I as defined above and one or more ingredients such as another pain reliever including acetaminophen or phenacetin; a potentiator including caffeine; an H2-antagonist, aluminum or

- 19 -

magnesium hydroxide, simethicone, a decongestant including phenylephrine, phenylpropanolamine, pseudophedrine, oxymetazoline, ephinephrine, naphazoline, xylometazoline, propylhexedrine, or levo-desoxyephedrine; an antiitussive including codeine, hydrocodone, 5 caramiphen, carbetapentane, or dextramethorphan; a diuretic; a sedating or non-sedating antihistamine. In addition the invention encompasses a method of treating cyclooxygenase mediated diseases comprising: administration to a patient in need of such treatment a non-toxic therapeutically effect amount of the compound of Formula I, optionally 10 co-administered with one or more of such ingredients as listed immediately above.

#### Pharmaceutical Compositions

For the treatment of any of these cyclooxygenase mediated 15 diseases compound I may be administered orally, topically, parenterally, by inhalation spray or rectally in dosage unit formulations containing conventional non-toxic pharmaceutically acceptable carriers, adjuvants and vehicles. The term parenteral as used herein includes subcutaneous injections, intravenous, intramuscular, intrasternal injection or infusion 20 techniques. In addition to the treatment of warm-blooded animals such as mice, rats, horses, cattle sheep, dogs, cats, etc., the compound of the invention is effective in the treatment of humans.

As indicated above, pharmaceutical compositions for treating cyclooxygenase-2 mediated diseases as defined may optionally 25 include one or more ingredients as listed above.

The pharmaceutical compositions containing the active ingredient may be in a form suitable for oral use, for example, as tablets, troches, lozenges, aqueous or oily suspensions, dispersible powders or granules, emulsions, hard or soft capsules, or syrups or elixirs. 30 Compositions intended for oral use may be prepared according to any method known to the art for the manufacture of pharmaceutical compositions and such compositions may contain one or more agents selected from the group consisting of sweetening agents, flavoring agents, coloring agents and preserving agents in order to provide

- 20 -

pharmaceutically elegant and palatable preparations. Tablets contain the active ingredient in admixture with non-toxic pharmaceutically acceptable excipients which are suitable for the manufacture of tablets. These excipients may be, for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example, corn starch, or alginic acid; binding agents, for example, starch, gelatin or acacia, and lubricating agents, for example, magnesium stearate, stearic acid or talc. The tablets may be uncoated or they may be coated by known techniques to delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or glyceryl distearate may be employed. They may also be coated by the technique described in the U.S. Patent 4,256,108; 4,166,452; and 4,265,874 to form osmotic therapeutic tablets for control release.

Formulations for oral use may also be presented as hard gelatin capsules wherein the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules wherein the active ingredients is mixed with water or miscible solvents such as propylene glycol, PEGs and ethanol, or an oil medium, for example, peanut oil, liquid paraffin, or olive oil.

Aqueous suspensions contain the active material in admixture with excipients suitable for the manufacture of aqueous suspensions. Such excipients are suspending agents, for example, sodium carboxymethyl-cellulose, methylcellulose, hydroxypropylmethycellulose, sodium alginate, polyvinyl-pyrrolidone, gum tragacanth and gum acacia; dispersing or wetting agents may be a naturally-occurring phosphatide, for example, lecithin, or condensation products of an alkylene oxide with fatty acids, for example, polyoxyethylene stearate, or condensation products of ethylene oxide with long chain aliphatic alcohols, for example, heptadecaethylene-oxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or condensation products of ethylene oxide with partial esters derived from fatty acids and hexitol

- 21 -

anhydrides, for example, polyethylene sorbitan monooleate. The aqueous suspensions may also contain one or more preservatives, for example, ethyl, or n-propyl, p-hydroxybenzoate, one or more coloring agents, one or more flavoring agents, and one or more sweetening agents, such as  
5 sucrose, saccharin or aspartame.

Oily suspensions may be formulated by suspending the active ingredient in a vegetable oil, for example, arachis oil, olive oil, sesame oil or coconut oil, or in mineral oil such as liquid paraffin. The oily suspensions may contain a thickening agent, for example, beeswax,  
10 hard paraffin or cetyl alcohol. Sweetening agents such as those set forth above, and flavoring agents may be added to provide a palatable oral preparation. These compositions may be preserved by the addition of an anti-oxidant such as ascorbic acid.

Dispersible powders and granules suitable for preparation of  
15 an aqueous suspension by the addition of water provide the active ingredient in admixture with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above. Additional excipients, for example, sweetening, flavoring and  
20 coloring agents, may also be present.

The pharmaceutical compositions of the invention may also be in the form of an oil-in-water emulsions. The oily phase may be a vegetable oil, for example, olive oil or arachis oil, or a mineral oil, for example, liquid paraffin or mixtures of these. Suitable emulsifying  
25 agents may be naturally-occurring phosphatides, for example, soy bean, lecithin, and esters or partial esters derived from fatty acids and hexitol anhydrides, for example, sorbitan monooleate, and condensation products of the said partial esters with ethylene oxide, for example, polyoxyethylene sorbitan monooleate. The emulsions may also contain  
30 sweetening and flavouring agents.

Syrups and elixirs may be formulated with sweetening agents, for example, glycerol, propylene glycol, sorbitol or sucrose. Such formulations may also contain a demulcent, a preservative and flavoring and coloring agents. The pharmaceutical compositions may be in the

- 22 -

form of a sterile injectable aqueous or oleagenous suspension. This suspension may be formulated according to the known art using those suitable dispersing or wetting agents and suspending agents which have been mentioned above. The sterile injectable preparation may also be a  
5 sterile injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example, as a solution in 1,3-butane diol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution. Cosolvents such as ethanol, propylene glycol or polyethylene glycols may  
10 also be used. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.

Compound I may also be administered in the form of a  
15 suppositories for rectal administration of the drug. These compositions can be prepared by mixing the drug with a suitable non-irritating excipient which is solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum to release the drug. Such materials are cocoa butter and polyethylene glycols.

20 For topical use, creams, ointments, gels, solutions or suspensions, etc., containing the compound of Formula I are employed. (For purposes of this application, topical application shall include mouth washes and gargles.) Topical formulations may generally be comprised of a pharmaceutical carrier, cosolvent, emulsifier, penetration enhancer,  
25 preservative system, and emollient.

Dosage levels of the order of from about 0.01 mg to about 140 mg/kg of body weight per day are useful in the treatment of the above-indicated conditions, or alternatively about 0.5 mg to about 7 g per patient per day. For example, inflammation may be effectively treated by  
30 the administration of from about 0.01 to 50 mg of the compound per kilogram of body weight per day, or alternatively about 0.5 mg to about 3.5 g per patient per day.

The amount of active ingredient that may be combined with the carrier materials to produce a single dosage form will vary depending

- 23 -

upon the host treated and the particular mode of administration. For example, a formulation intended for the oral administration of humans may contain from 0.5 mg to 5 g of active agent compounded with an appropriate and convenient amount of carrier material which may vary  
5 from about 5 to about 95 percent of the total composition. Dosage unit forms will generally contain between from about 1 mg to about 500 mg of an active ingredient, typically 25 mg, 50 mg, 100 mg, 200 mg, 300 mg, 400 mg, 500 mg, 600 mg, 800 mg, or 1000 mg.

It will be understood, however, that the specific dose level  
10 for any particular patient will depend upon a variety of factors including the age, body weight, general health, sex, diet, time of administration, route of administration, rate of excretion, drug combination and the severity of the particular disease undergoing therapy.

#### 15 Methods of Synthesis

The compounds of the present invention can be prepared according to the following methods:

##### Method A

20 An aryl hydrazine II and a methyl ketone III are coupled via a Fischer indole synthesis in acetic acid at 60°C to 100°C or alternatively in 4M HCl in dioxane at 60°C or alternatively in ethanolic HCl at reflux. The indole IV thus obtained may be benzylated by first deprotonating with KHMDS in THF/HMPA at -78°C to 0°C or alternatively with  
25 sodium hydride in DMF at room temperature, followed by treatment with a benzyl halide V to provide N-benzylated indole Ib. In the case of R=H in compound IV, the benzylation may be accomplished by treatment of IV in THF/HMPA at -78°C with two equivalents of *n*-BuLi followed by addition of benzyl halide V, to directly afford examples of compound Ia.  
30 In the case of a benzylated indole VI without  $\alpha$ -substituents (a special case of IV in which  $R^4 = R^5 = H$ ), an  $\alpha$ -substituent may be introduced by enolization with LDA at -78°C to 0°C followed by treatment with an alkyl halide to provide VII. A second substituent may be similarly introduced to compound VII by sequential treatment with LDA and an

- 24 -

alkyl halide to provide Ib. Compounds Ib and VII are examples of the present invention. Alkaline hydrolysis of esters Ib or VII provide examples of compound Ia of the present invention.

5    Method B

A substituted indole VIII may be formylated in the 3-position with DMF/POCl<sub>3</sub> to provide compound IX (R<sup>2</sup>=H).

Alternatively, VIII may be acylated using an appropriate anhydride or acid chloride to provide compound IX. For certain acylating agents, the  
10   addition of a Lewis acid catalyst (exemplified by AlCl<sub>3</sub>) may be required for this reaction to proceed. Compound IX may be benzylated by treatment with V in DMF in the presence of sodium hydride to provide compound X. This compound may be reacted with a stabilized Wittig reagent XI in refluxing toluene to provide compound XII. For certain R<sup>2</sup>  
15   and R<sup>4</sup> groups, elevated pressure (> 2000 psi) and elevated temperature (>140°C) may be required for this reaction to proceed. Treatment of XII with a lithium dialkyl cuprate in the presence of TMSCl provides the alkylated product VII. Alternatively, XII may be treated with 50 psi H<sub>2</sub> in the presence of PtO<sub>2</sub> to provide compound XIII. Esters VII and XIII  
20   are examples of compound Ib of this invention, and hydrolysis of them provides examples of acid Ia of the present invention.

Method C

Benzylated indole X may be reacted with the ylid formed  
25   from methyl triphenylphosphonium bromide and potassium *tert*-butoxide to give the olefin XIV. Tetra-acyloxy rhodium catalyzed cyclopropanation of XIV with an  $\alpha$ -diazoester XV at room temperature provides compound XVI, which can be hydrolyzed to give compound XVII. Both XVI and XVII are representative examples of Ib and Ia.

30

Method D

Benzylated indole X may be reacted with an enolate obtained by treatment of ester XVIII with LDA at -78°C to provide the aldol adduct XIX. The hydroxyl group of this aldol adduct may be

- 25 -

derivatized by treatment with electrophilic alkylating agents exemplified by Me<sub>3</sub>OBf<sub>4</sub>, to give the methyl ether XXI, and a substituted benzyl trichloroacetimidate XX, to give benzyl ether XXII. Subsequent alkaline hydrolysis of compounds XXI and XXII will provide compounds XXIII and XXIV respectively; these four compounds are examples of the present invention.

#### Method E

The cyclopropyl alcohol XXV (Eur. Pat. 604,114, Example 1, Step 7, Case 18907) may be oxidized under the conditions of Swern to aldehyde XXVI. Treatment of this aldehyde with Ph<sub>3</sub>P=CHOMe, followed by hydrolysis of the resulting vinyl methyl ether will provide aldehyde XXVII. Addition of methyl magnesium bromide to this aldehyde followed by Swern oxidation of the resulting alcohol will provide methyl ketone XXVIII. Hydrazine II may be benzylated by treatment with benzyl bromide V in the presence of a base such as potassium carbonate to provide N-benzyl hydrazine XXIX. This hydrazine may be isolated as its free base or alternatively as its hydrochloride salt. This hydrazine may be reacted with ketone XXVIII to provide indole XXX by first treating with acetic acid in toluene followed by heating the resulting hydrazone at 60°C in 4M HCl/dioxane. The nitrile functionality of indole XXX may be hydrolyzed to the carboxylic acid XXXI by first treating with methanolic HCl, followed by alkaline hydrolysis. XXXI is an example of compound Ia of the present invention.

#### Method F

It will be obvious to one skilled in the art that asymmetrically substituted compounds Ia may be synthesized as pure enantiomers or may be resolved into their pure enantiomers. For example, racemic Ia may be treated with KHMDS followed by pivaloyl chloride to form a mixed anhydride. The lithium salt of a chiral oxazolidinone may then be added to form a diastereotopic mixture of chiral imides XXXII and XXXIII, which are examples of compound Ib of

- 26 -

the present invention. These two compounds may then be separated by chromatography or crystallization to provide the pure diastereomers. Each pure diastereomer may then be hydrolyzed independently with lithium hydroperoxide to generate the pure enantiomers XXXIV and XXXV  
5 which are examples of compound 1a of the present invention.

#### Method G

An indolepropanoic acid of the type 1a may be treated with 1,1'-carbonyldiimidazole in dichloromethane at room temperature to form  
10 an active ester. Subsequent treatment with an amine, acetamide, or sulfonamide of structure  $\text{HNR}^9\text{R}^{10}$  and DMAP provides the desired amide, imide or acylsulfonamide which are examples of compound 1c of the present invention. Alternatively the coupling may be performed by reacting the lithium salt  $\text{LiNR}^9\text{R}^{10}$  with the mixed anhydride described  
15 in Method F, thus providing examples of compound 1c of the present invention.

### Assays for Determining Biological Activity

The compound of Formula I can be tested using the following assays to determine their cyclooxygenase-2 inhibiting activity.

#### 5 Inhibition of Cyclooxygenase Activity

Compounds were tested as inhibitors of cyclooxygenase activity in whole cell cyclooxygenase assays. Both of these assays measured prostaglandin E<sub>2</sub> synthesis in response to arachidonic acid, using a radioimmunoassay. Cells used for these assays were human  
10 osteosarcoma 143 cells (which specifically express cyclooxygenase-2) and human U-937 cells (which specifically express cyclooxygenase-1). In these assays, 100% activity is defined as the difference between prostaglandin E<sub>2</sub> synthesis in the absence and presence of arachidonate addition.

15

#### Assay

For cyclooxygenase assays, osteosarcoma cells are cultured in 1 mL of media in 24-well multidishes (Nunc) until confluent (1-2 x 10<sup>5</sup> cells/well). U-937 cells are grown in spinner flasks and resuspended to a final density of 1.5 x 10<sup>6</sup> cells/mL in 24-well multidishes (Nunc).  
20 Following washing and resuspension of osteosarcoma and U-937 cells in 1 mL of Hanks balanced salts solution (HBSS), 2 µL of a DMSO solution of test compound or DMSO vehicle is added, and samples gently mixed. All assays are performed in triplicate. Samples are then  
25 incubated for 5 or 15 minutes at 37°C, prior to the addition of arachidonic acid. Arachidonic acid (peroxide-free, Cayman Chemical) is prepared as a 10 mM stock solution in ethanol and further diluted 10-fold in HBSS. An aliquot of 10 µL of this diluted solution is added to the cells to give a final arachidonic acid concentration of 10 µM. Control samples are  
30 incubated with ethanol vehicle instead of arachidonic acid. Samples are again gently mixed and incubated for a further 10 min at 37°C. For osteosarcoma cells, reactions are then stopped by the addition of 100 µL of 1N HCl, with mixing and by the rapid removal of the solution from cell monolayers. For U-937 cells, reactions are stopped by the addition of

- 45 -

100  $\mu$ L of 1N HCl, with mixing. Samples are then neutralized by the addition of 100  $\mu$ L of 1N NaOH and PGE<sub>2</sub> levels measured by radioimmunoassay.

5 Rat Paw Edema Assay - Protocol

Male Sprague-Dawley rats (150-200 g) are fasted overnight and are given po either vehicle (1% methocel or 5% Tween 80) or a test compound. One hr later, a line is drawn using a permanent marker at the level above the ankle in one hind paw to define the area of the paw to be  
10 monitored. The paw volume (V<sub>0</sub>) is measured using a plethysmometer (Ugo-Basile, Italy) based on the principle of water displacement. The animals are then injected subplantarily with 50  $\mu$ l of 1% carrageenan solution in saline (FMC Corp, Maine) into the paw using an insulin syringe with a 25-gauge needle (i.e., 500  $\mu$ g carrageenan per paw). Three  
15 hr later, the paw volume (V<sub>3</sub>) is measured and the increases in paw volume (V<sub>3</sub> - V<sub>0</sub>) are calculated. The animals are sacrificed by CO<sub>2</sub> asphyxiation and the absence or presence of stomach lesions scored. Data is compared with the vehicle-control values and percent inhibition calculated. All treatment groups are coded to eliminate observer bias.

20

NSAID-Induced Gastrophathy in Rats

Rationale

The major side effect of conventional NSAIDs is their ability  
25 to produce gastric lesions in man. This action is believed to be caused by inhibition of Cox-1 in the gastrointestinal tract. Rats are particularly sensitive to the actions of NSAIDs. In fact, rat models have been used commonly in the past to evaluate the gastrointestinal side effects of current conventional NSAIDs. In the present assay, NSAID-induced  
30 gastrointestinal damage is observed by measuring fecal <sup>51</sup>Cr excretion after systemic injection of <sup>51</sup>Cr-labeled red blood cells. Fecal <sup>51</sup>Cr excretion is a well-established and sensitive technique to detect gastrointestinal integrity in animals and man.

- 46 -

### Methods

Male Sprague Dawley rats (150 - 200 g) are administered orally a test compound either once (acute dosing) or b.i.d. for 5 days (chronic dosing). Immediately after the administration of the last dose, the rats are injected via a tail vein with 0.5 mL of  $^{51}\text{Cr}$ -labeled red blood cells from a donor rat. The animals are placed individually in metabolism cages with food and water *ad lib*. Feces are collected for a 48 h period and  $^{51}\text{Cr}$  fecal excretion is calculated as a percent of total injected dose.  $^{51}\text{Cr}$ -labeled red blood cells are prepared using the following procedures.

Ten mL of blood is collected in heparinized tubes via the vena cava from a donor rat. Plasma is removed by centrifugation and replenished with equal volume of Hanks' balanced salt solution (HBSS). The red blood cells are incubated with 400  $\mu\text{Ci}$  of sodium  $^{51}\text{Cr}$ chromate for 30 min at 37°C. At the end of the incubation, the red blood cells are washed twice with 20 mL HBSS to remove free sodium  $^{51}\text{Cr}$ chromate. The red blood cells are finally reconstituted in 10 mL HBSS and 0.5 mL of the solution (about 20  $\mu\text{Ci}$ ) is injected per rat.

### Protein-Losing Gastropathy in Squirrel Monkeys

#### Rationale

Protein-losing gastropathy (manifested as appearance of circulating cells and plasma proteins in the GI tract) is a significant and dose-limiting adverse response to standard non-steroidal anti-inflammatory drugs (NSAIDs). This can be quantitatively assessed by intravenous administration of  $^{51}\text{CrCl}_3$  solution. This isotopic ion can avidly bind to cell and serum globins and cell endoplasmic reticulum. Measurement of radioactivity appearing in feces collected for 24 h after administration of the isotope thus provides a sensitive and quantitative index of protein-losing gastropathy.

#### Methods

Groups of male squirrel monkeys (0.8 to 1.4 kg) are treated by gavage with either 1% methocell or 5% Tween 80 in H<sub>2</sub>O vehicles,

- 47 -

(3mL/kg b.i.d.) or test compounds at doses from 1 - 100 mg/kg b.i.d. for 5 days. Intravenous  $^{51}\text{Cr}$  (5 $\mu\text{Ci/kg}$  in 1 ml/kg phosphate buffer saline (PBS)) is administered 1 h after the last drug/vehicle dose, and feces collected for 24 h in a metabolism cage and assessed for excreted  $^{51}\text{Cr}$  by gamma-counting. Venous blood is sampled 1 h and 8 h after the last drug dose, and plasma concentrations of drug measured by RP-HPLC.

### Representative Biological Data

Compounds of the present invention are inhibitors of cyclooxygenase-2 and are thereby useful in the treatment of cyclooxygenase-2 mediated diseases as enumerated above. The activities of the compounds against cyclooxygenase may be seen in the representative results shown below. In the assay, inhibition is determined by measuring the amount of prostaglandin E<sub>2</sub> (PGE<sub>2</sub>) synthesized in the presence of arachidonic acid, cyclooxygenase-1 or cyclooxygenase-2 and a putative inhibitor. The IC<sub>50</sub> values represent the concentration of putative inhibitor required to return PGE<sub>2</sub> synthesis to 50% of that obtained as compared to the uninhibited control.

Representative results for the inhibition of PGE<sub>2</sub> production and edema inhibition may be seen in Table IV. For comparison purposes, the Table also contains data for the conventional NSAID indomethacin and for the compound  $\alpha$ -(1-*p*-chlorobenzyl-2-methyl-5-methoxy-3-indolyl)propionic acid (also known as MK-555). This latter compound is disclosed in British Patent Specification 957,990 (May 13, 1964) as having anti-inflammatory activity.

EXAMPLE 13-[1-(p-Bromobenzyl)-5-methoxy-2-methylindol-3-yl]propanoic acid5    Step 1:    3-(5-Methoxy-2-methylindol-3-yl)propanoic acid

A mixture of 5-methoxyphenylhydrazine hydrochloride (10.0 g, 57.3 mmol) and 5-ketohexanoic acid (7.54 g, 57.9 mmol) was suspended in 50 mL of acetic acid. The mixture was stirred 30 min at room temperature, 30 min at 60°C, and 16 h at 90°C. The resulting  
10 solution was cooled diluted with heptane and concentrated *in vacuo*. The residue was partitioned between water and ethyl acetate. The organic layer was washed with water and brine, dried over MgSO<sub>4</sub>, filtered and evaporated. The resulting solid was swished from ether/hexanes to give 4.97 g of the title compound as a grey powder.  
15 <sup>1</sup>H NMR (CD<sub>3</sub>COCD<sub>3</sub>) δ 7.13 (1H, d), 7.00 (1H, d), 6.64 (1H, dd), 3.78 (3H, s), 2.97 (2H, t), 2.56 (2H, t), 2.37 (3H, s).

Step 2:    3-[1-(p-Bromobenzyl)-5-methoxy-2-methylindol-3-yl]-

Soc., Perkin 2*, 1979, 1535) (2.5 g, 22.7 mmol), sodium periodate (19.4 g, 90.7 mmol), and ruthenium(IV) oxide (66 mg, 0.50 mmol) was suspended in 140 mL of  $\text{CCl}_4/\text{CH}_3\text{CN}/\text{H}_2\text{O}$  (2:2:3) and stirred vigorously for 1 h. The mixture was then diluted with water and extracted three times with  $\text{CH}_2\text{Cl}_2$ . The combined organic phases were dried over  $\text{MgSO}_4$  and evaporated. Purification of the residue provided the title compound as a colorless liquid.

20 Step 2: 3-[1-(p-Bromobenzyl)-5-methoxy-2-methylindol-3-yl]-3-methylbutanoic acid

Using the acid from Step 1 and the method of Example 1, the title compound was obtained.

# INTERNATIONAL SEARCH REPORT

International application No.

PCT/CA96/00326

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
Although claims 10-13 are directed to a method of treatment of (diagnostic method practised on) the human/animal body the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
